

# CHaMP

## **STATUS OF GEOMORPHIC CHANGE DETECTION OF 2011 TO 2012 SURVEYS**

**Joe Wheaton**

**Wally Macfarlane**

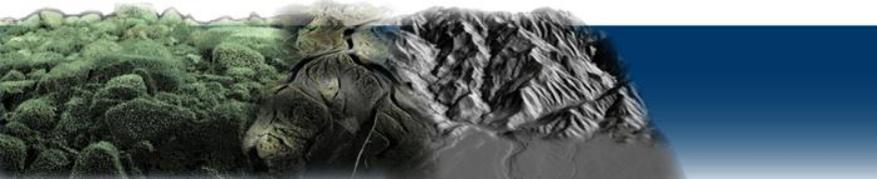

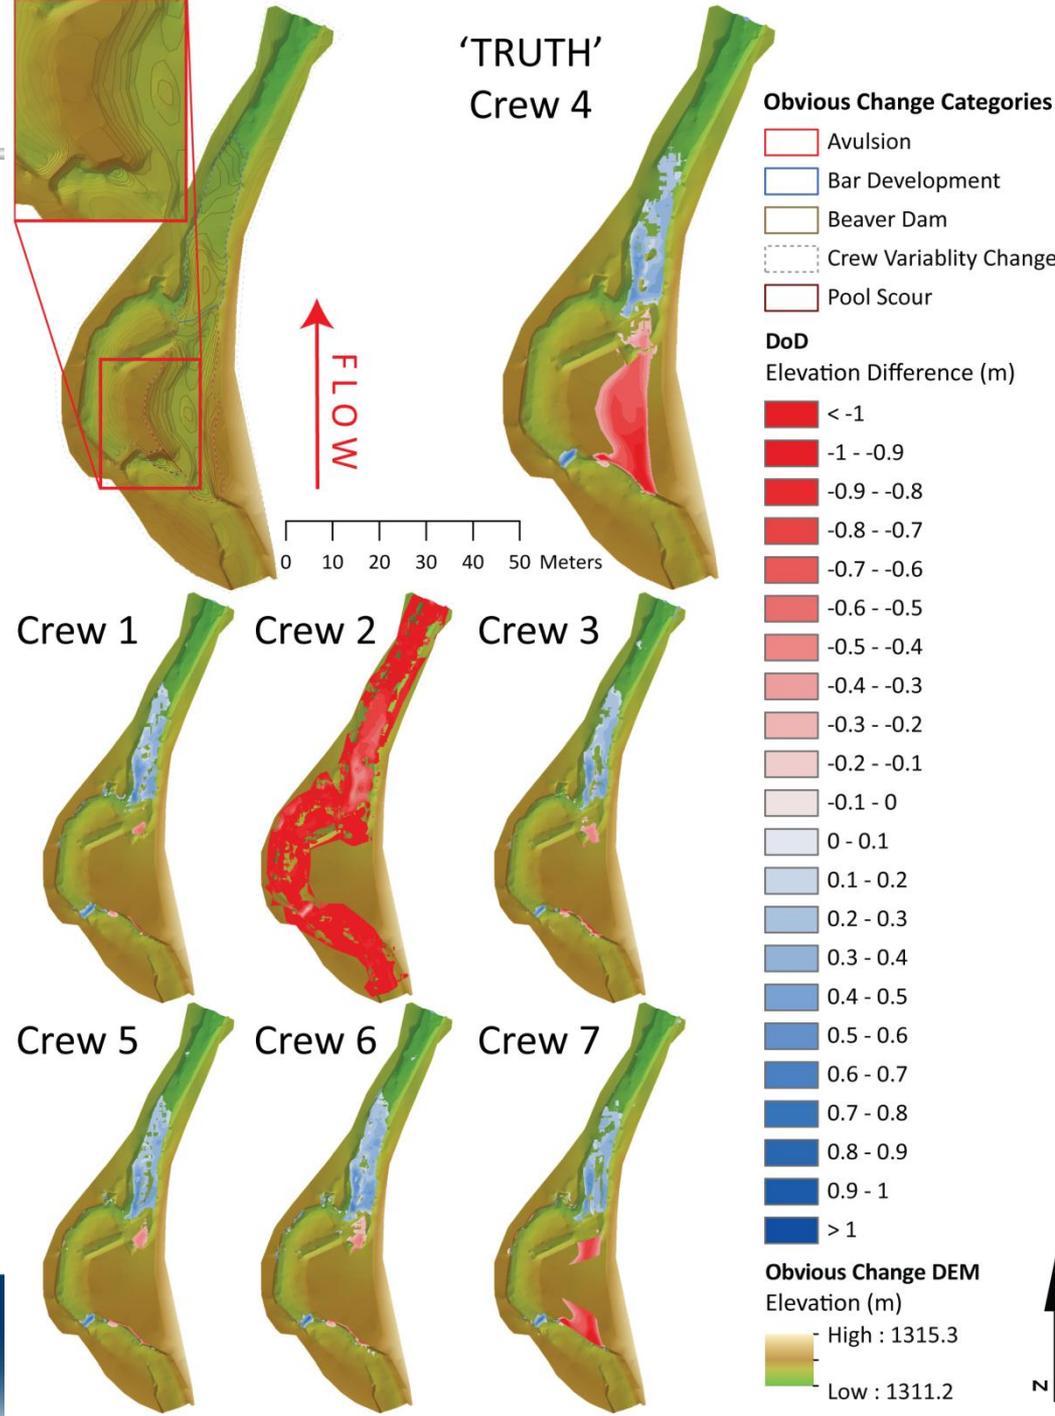

**Phillip Bailey**

CHaMP Post-Season Workshop

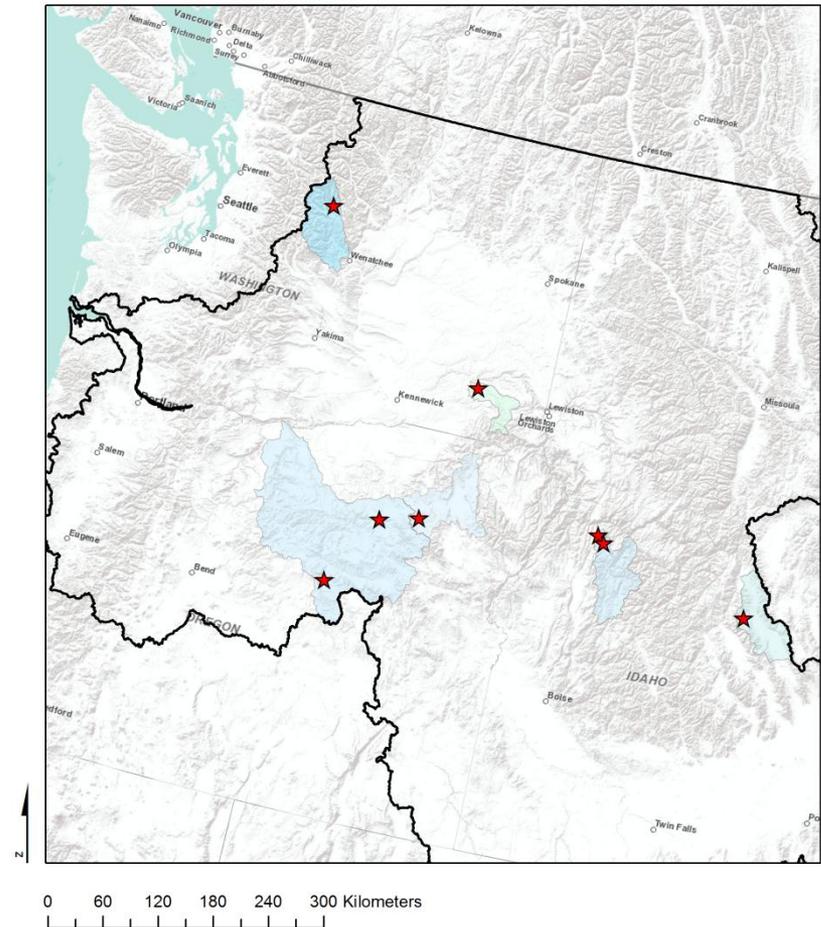

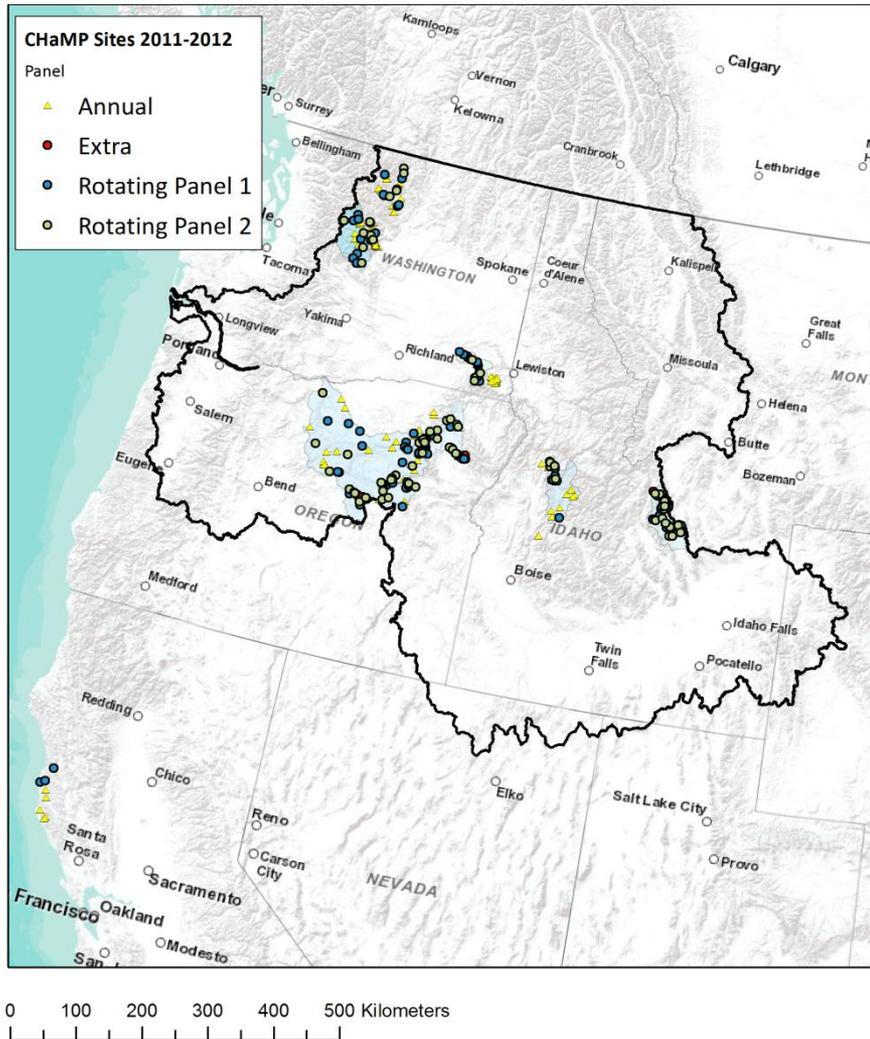

November 27, 2012

# ACKNOWLEDGEMENTS

- All the CHaMP Crews
- Boyd Bouwes
- Andy Hill & Entire ELR Team
- Kelly Whitehead & Carol Volk
- Steve Rentmeister & SITKA
- ET-AL

# 2011-2012 ANNUAL SITES w/ GCD

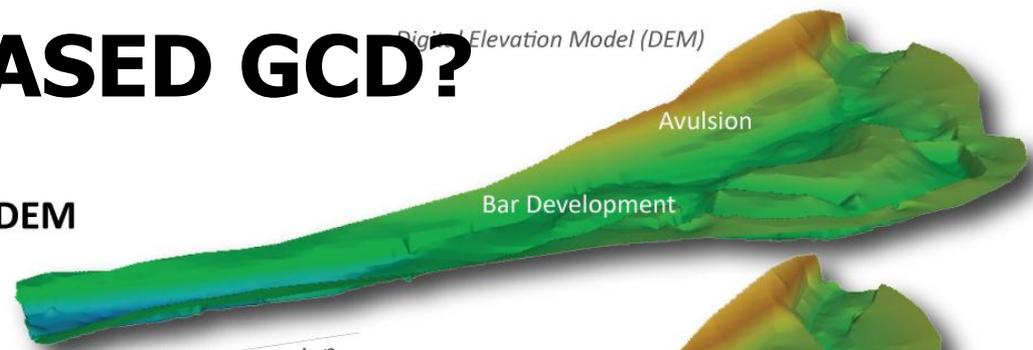

# WHAT IS DEM-BASED GCD?

A little background...

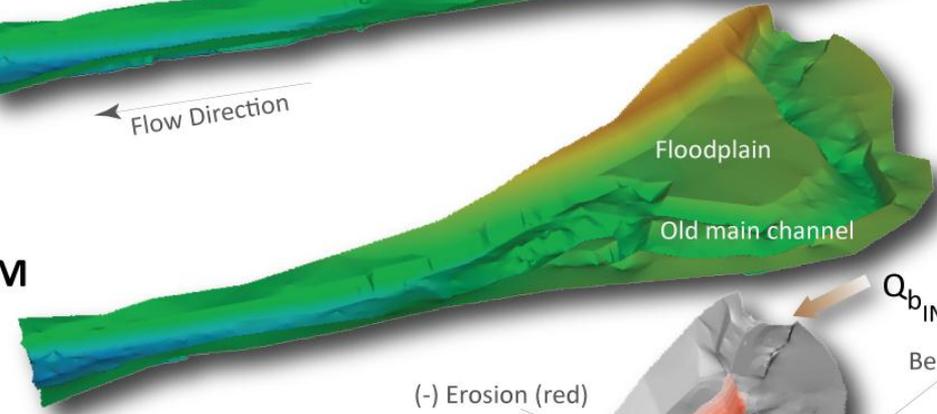

- DEM -> digital elevation model
- GCD -> geomorphic change detection
- Of everything that CHaMP measures, GCD is one of most sensitive to the quality of the data and influences like crew variability

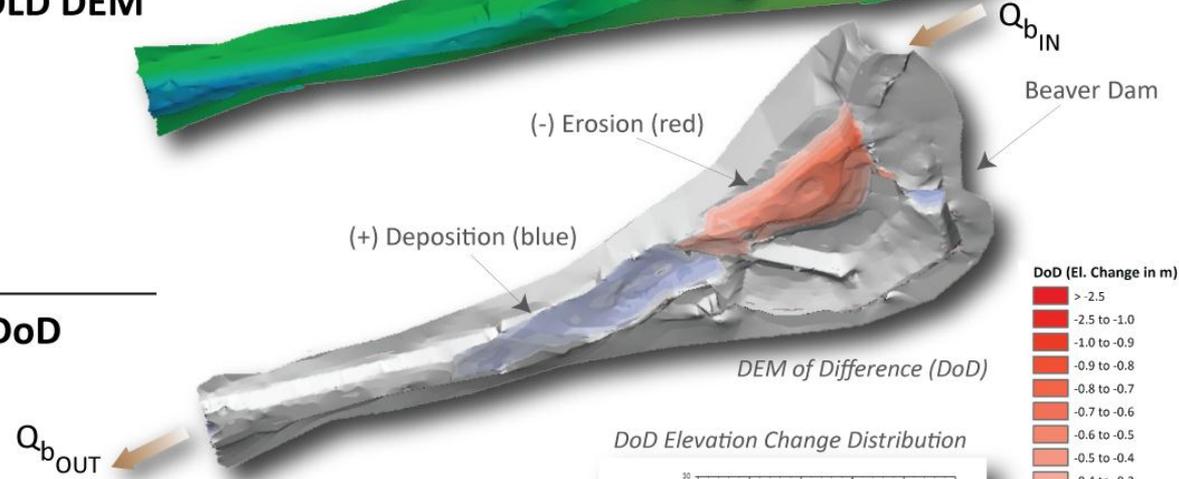

NEW DEM

-OLD DEM

=DoD

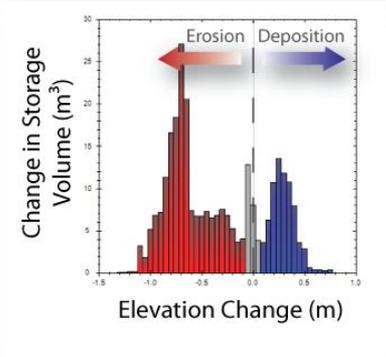

Morphological Sediment Budget:

$$Q_{b_{IN}} - Q_{b_{OUT}} = \frac{\Delta V_{DoD}}{\Delta t}$$

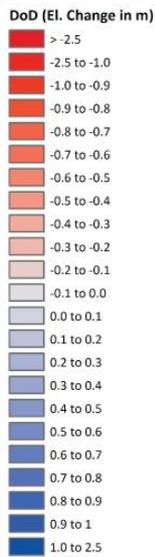

Bedload Flux Difference      Change in Storage

$$\Delta V_{DoD} = \Sigma V_{Deposition} - \Sigma V_{Erosion}$$

DoD Elevation Change Distribution

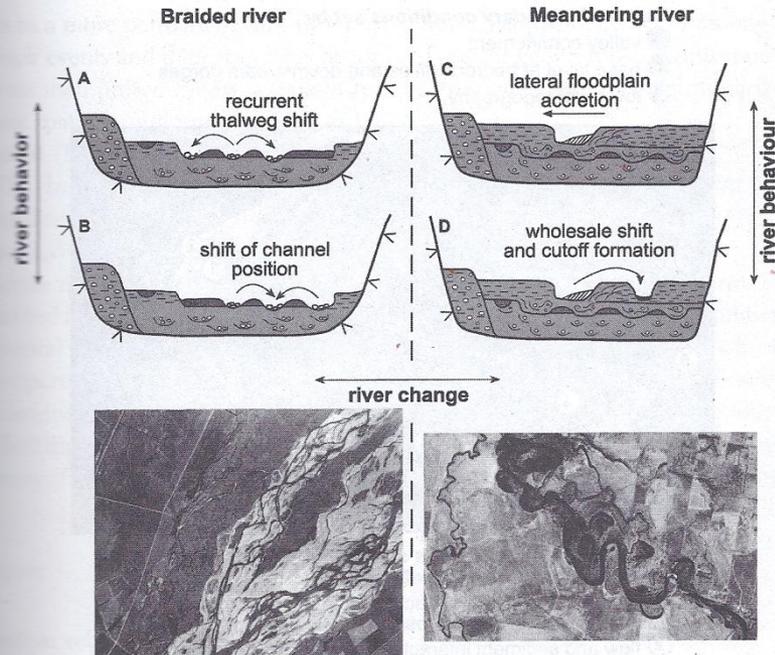

$\Sigma V_{Erosion}$        $\Sigma V_{Deposition}$

# CHANGE VS. BEHAVIOR

Chapter 5: Working with Change 67

River behavior and river change. River *behavior* reflects adjustments that occur within the natural capacity for adjustment of a river such as those depicted for the braided river in sections A and B and for the meandering river in sections C and D. River *change* reflects a wholesale shift in river type as depicted by the transition from a braided to a meandering river.

SOCIETY FOR ECOLOGICAL RESTORATION INTERNATIONAL

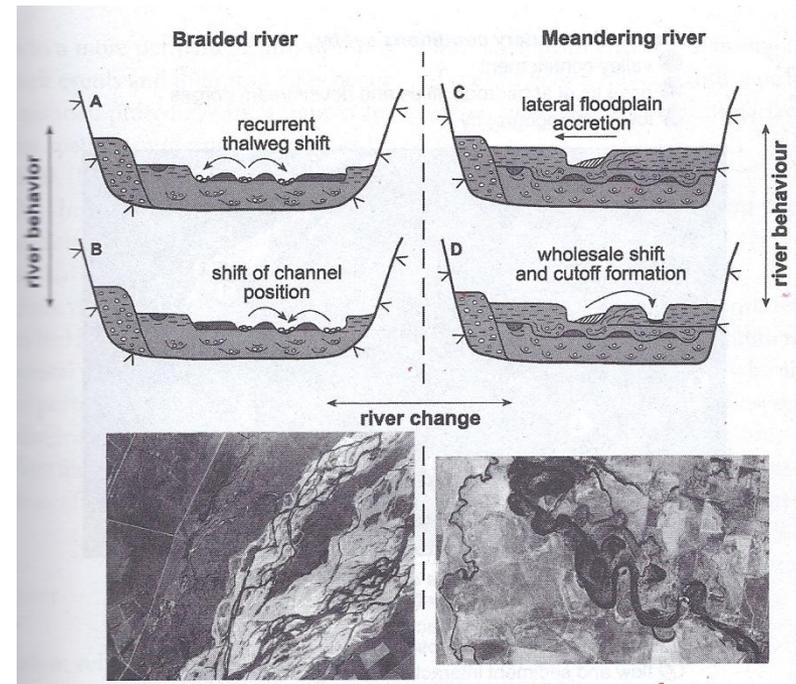

## River Futures

*An Integrative Scientific Approach to River Repair*

Edited by Gary J. Brierley and Kirstie A. Fryirs

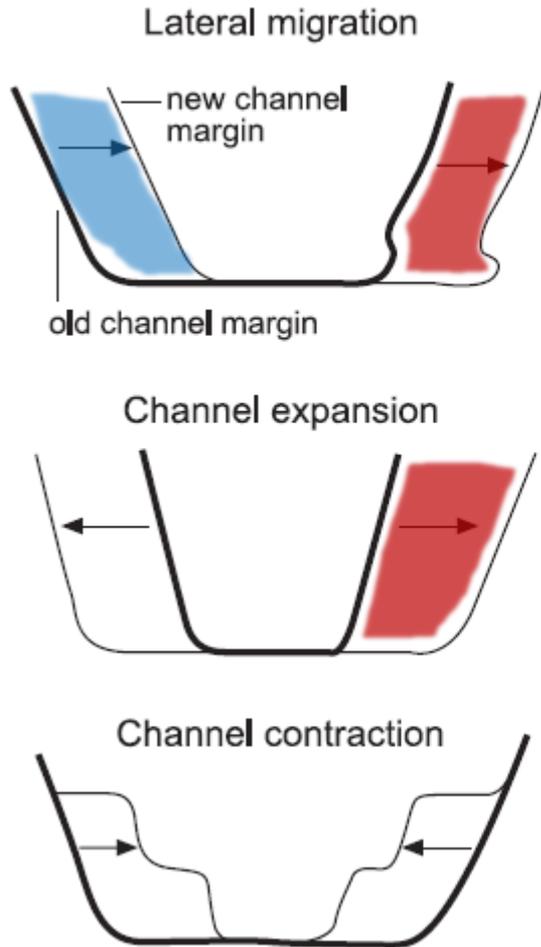

# WAYS A RIVER CAN ADJUST LOCALLY

- Adjustments  
(Erosion/Deposition)
  - Channel morphology
    - Channel Size
    - Channel Shape
  - Bed Character
  - Planform
  - Arrangement of geomorphic units
- An adjustment is not a *change* in river type!
- “River *behavior* equates to adjustments around a characteristic assemblage of geomorphic units”

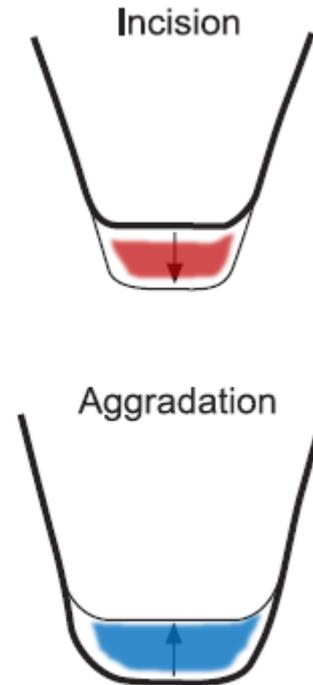

# FORMS OF ADJUSTMENT TO CHANNEL SHAPE

## Lateral adjustment processes

## Vertical adjustment processes

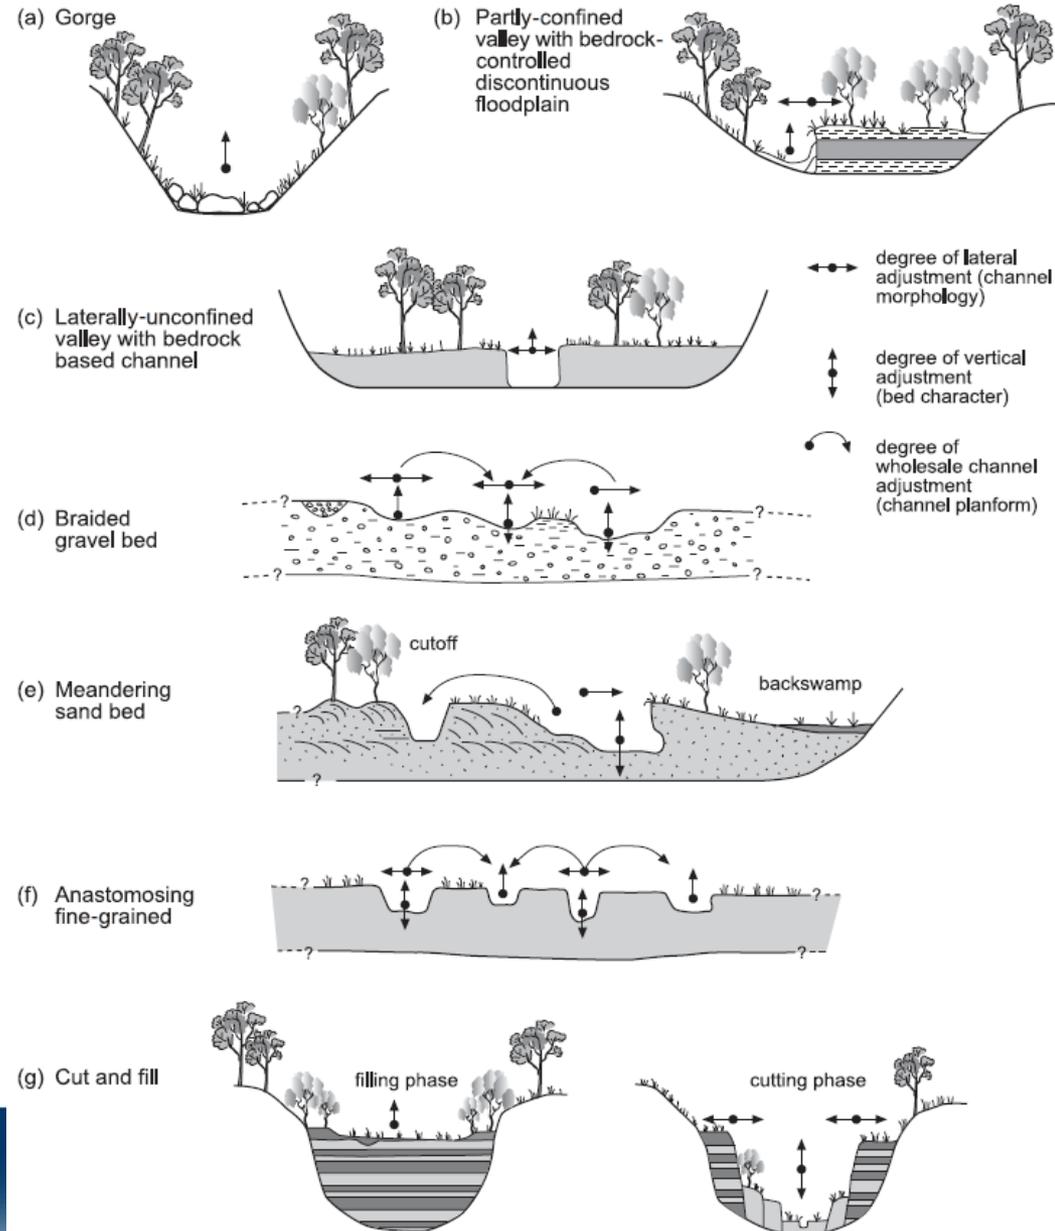

- Geomorphologists have lots of special names for things...
- Basically, all expressions or special cases of **erosion** or **deposition**

From Brierley & Fryirs (2005)

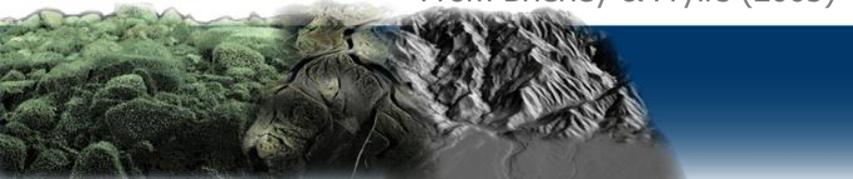

# NATURAL CAPACITY FOR ADJUSTMENT

- Plausible limits on what adjustments are possible

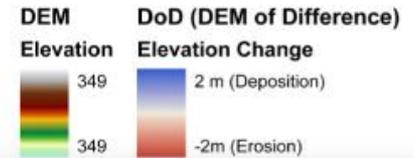

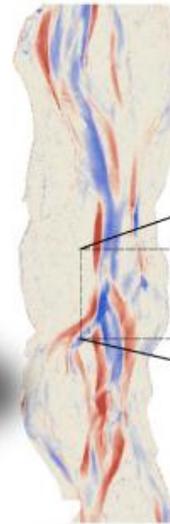

From Brierley & Fryirs (2005)

# CHANGE DETECTION WITH DEM DIFFERENCING

Simple method of quantifying spatial variations in change in storage terms of a sediment budget.

$$\text{NEW DEM} - \text{OLD DEM} = \text{DoD}$$

NEW DEM

OLD DEM

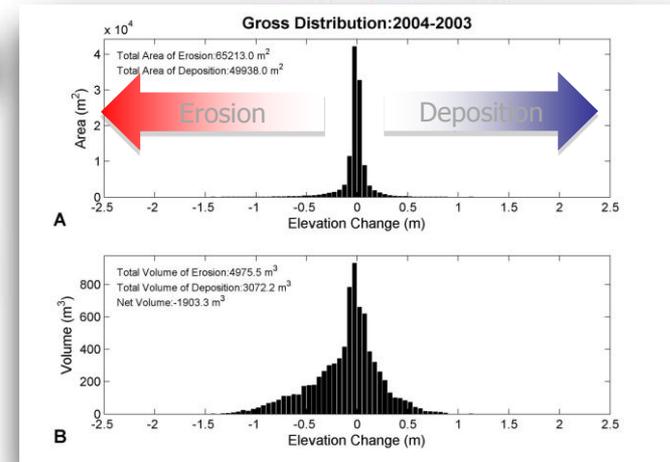

= DoD

CONSERVATION OF MASS  
VOLUMETRIC

$$Q_{bi} - Q_{bo} = (1 - \eta) \frac{dV_b}{dt}$$

↑ Volumetric rate of bed material transport

↑ Porosity of bed material

Mclean & Church (1988) – Water Resources Research

© Wheaton (2008)

# IN A PERFECT WORLD...

- The signal (the change we're trying to detect) is much greater than our noise....

$$\frac{\partial z}{\partial t} \gg \delta(z)$$

- In many instances, the noise is of similar magnitude to our noise...

$$\frac{\partial z}{\partial t} \approx \delta(z)$$

- Better in places where vertical changes are large!

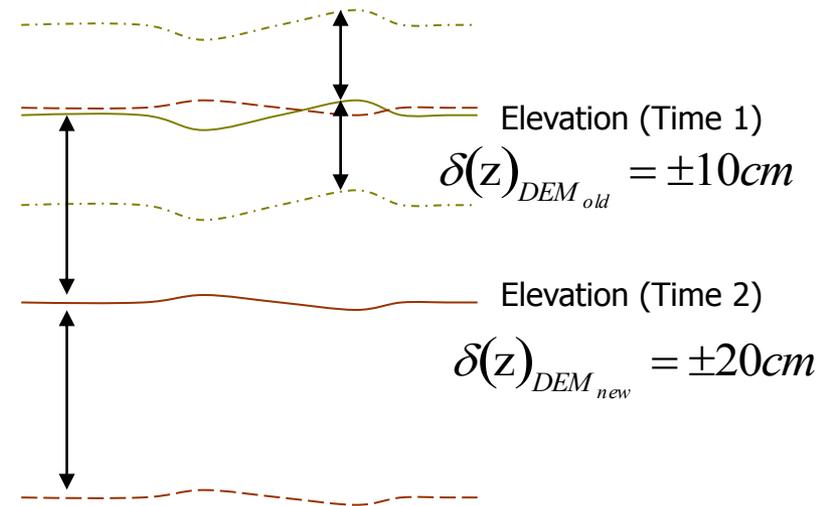

Surface Noise:

- LiDaR : +/- 10 to 25 cm (14 to 36 cm <sub>min</sub>LoD)
- Total Station: +/- 2 to 10 cm (3 to 14 cm <sub>min</sub>LoD)

# SMALL PROBLEM...

- Distinguish those changes that are real from noise
- Use standard Error Propagation
- Errors assumed to be spatially uniform, but can vary temporally

$$\delta(z) = \sqrt{\left(\delta(z)_{DEM_{old}}\right)^2 + \left(\delta(z)_{DEM_{new}}\right)^2}$$

e.g.  $\delta(z) = \sqrt{(10)^2 + (20)^2} = 22.36$

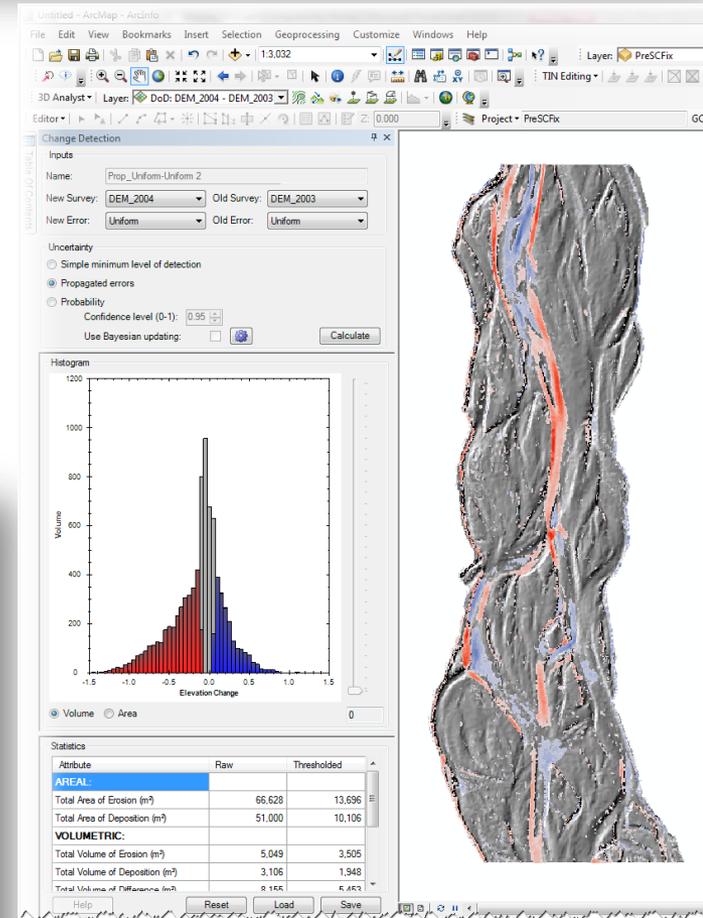

$22.36 \text{ cm} \approx 8.8 \text{ in}$

# GCD NOW IN RBT-CHAMP

- **GCD 5** makes it easy to:
  - Robustly estimate errors in DEMs
  - Determine significance of uncertainty on DoD & Sediment Budget
  - Calculate change in storage sediment budgets (with +/- vol.)
  - Quantitatively interpret and spatially segregate budget

About The Geomorphic Change Detection ArcGIS 10 Extension

### Geomorphic Change Detection

 The Geomorphic Change Detection software was originally developed by Joe Wheaton (Utah State University), Chris Garand (Utah State University), and James Brasington (Queen Mary, University of London). The newest version of the GCD is currently under development by ESSA Technologies for Joe Wheaton with financial support from the US Geological Survey's Grand Canyon Monitoring and Research Center (USGS Co-Op Agreement No. 08WRAG0053) and Idaho Power Company. Past financial support was provided by the Intermountain Center for River Rehabilitation and Restoration at Utah State University. We are indebted to many helpful and patient Beta Testers, including all the participants of the GCD Workshops, Sara Banger, Rocko Brown, Nicole Czarnowski, Kerry DeMeurichy, Paul Grams, Alan Kasprak, Ryan Leasy, Chuck Podolack, Robert Ross and Cara Walter.

The current development team consists of: [Joe Wheaton](#) [Philip Bailey](#) [Nick Ochosi](#) [Frank Poulsen](#)

- What's here? Where did it come from?

# SOON.... NOT YET

# MAIN TAKE HOMES

---

- GCD Results Now Automated
- We're seeing that one-size fits all error model is too conservative
- We might want to show crews their error models
- Still QA/QC... Roughly 12 of 120 need further attention
- Some refinements required, but first cut is promising
- Too soon to inter-compare basins, but soon
